Buoyant Charm (2001 version)

For small ensemble and computer

Duration 16`30

Original version 1997

Natasha Barrett

Buoyant Charm (2001 version)

For bass flute, doubling Eb-alto saxophone, (two separate parts are available is necessary), bass clarinet, percussion, piano, violin, double bass, and computer.

Technical requirements:

1. G3 Mactintosh computer
2. MAX/MSP patch and audio materials (see enclosed CD).
3. 2 GB unfragmented harddisk space
4. Stereo sound card (do not use the computer's built-in sound outputs).
5. MIDI interface for the computer, foot switch pedal, and hardware to covert the switch input into MIDI (e.g. use the foot switch input of an effects module, or hardware such as the NoTAM MIDI-box).
6. At least four loudspeakers powerful enough to fill the concert space (8 loudspeakers are recommended), and a suitable mixing desk.
7. Microphones to amplify the ensemble.

External reverberation effects module.

See figure 1 for an overview of the performance set-up.

General notes:

Always used balanced signals where possible. One person who can read music and who knows the piece should be sitting at the mixing desk balancing the sound. Throughout the performance the electroacoustic material should be of equal level to the amplified live instruments. A small amount of reverberation effect should be used on the amplified sound, unless the concert space is very large.

The computer part consists of sound files that are triggered via the foot switch during the performance. A separate part is available for the performer triggering the sound files. Alternatively, the conductor can be responsible for this, (reading from the master score).

Copies of the audio CD of the complete computer part is enclosed. Both conductor and performers should rehearse by listening several times to this CD while reading the music. A CDr of computer materials is also enclosed for performance.

Buoyant charm was composed in 1997 for a group of improvisers (Chris Burns- piano, Phil Durrant — violin, Alexander Frauenheim — double bass, Ben Harlan — clarinet, Jim Denly — Saxophone and flute, Steve Nobel - percussion). The 2001 version is rewritten for a more conventional contemporary performance group, and has been reduced from 25`30 to 16'00 in duration. I would like to thank the original group for their work providing the source sounds for the computer part. They also provided much inspiration through their expansive sound and gestural palette. Their individual performance styles have inevitably coloured the revision of this piece.

Notation - Percussion

Percussion instrumentation is split into three groups: metal, skin, and wood. Changes of instruments within these groups are indicated with text in the score. The instruments are:

Metal

1. Three items of *heavy scrap metal*. The objects should have clearly different pitches, and give a clear loud sound when hit with a rubber beater.

2. *Crotales*: C, C#, D#, E, F, G# Bb (pitches specified in the score span two octaves, but if two octaves are not available, any octave is suitable).

3. *Cymbals*: large, medium, small.

4. *Buffalo Bells* (or almaglocken bells, named 'bell' in the score): mid Eb, low C mid C#. (NOTE: the pitch is important. If there is a problem obtaining the correct pitches, use bowls to supplement the buffollo bells).

5. *Cow bells*: two different pitches.

6. *Tam*: any size tam (from medium to large) that gives a loud lengthy resonance when scraped. The larger the better.

Notation: the 'metal' staff consists on four lines. The lower three lines are for the 'heavy scrap metals' and cymbals, where the lowest pitch is the bottom line of the staff. The top line is for the buffalo bells, the cow bells and the tam. The crotales are notated on a normal five line staff.

Skin

1. Toms: large floor tom, medium tom, high tom.
2. 25 inch timpani (range Bb-F)

Notation: the 'skin' staff consists of three lines. The floor tom is notated on the bottom line, and the medium and high toms above. The timpani is also notated on this staff. The bottom line is for a pitch about 1/4 of the range up from the lowest pitch, the middle line for a pitch in the middle of the range, and the top line for a pitch 1/4 from the top note. The exact pitch is not specified apart from in two locations.

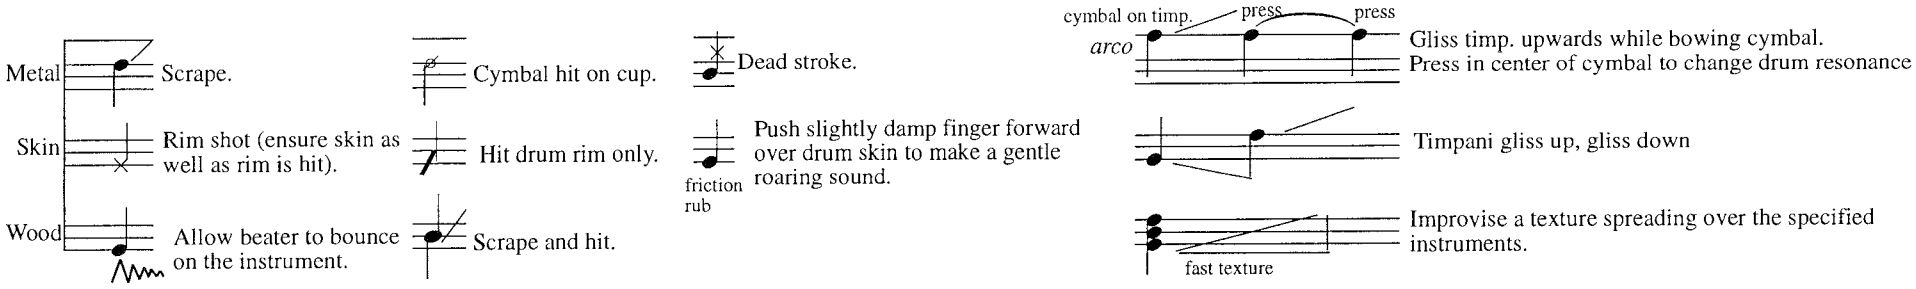
Wood

1. Three wood blocks of different pitches.
2. Three temple blocks of lower pitch than the woodblocks.

Notation: The 'wood' staff consists of three lines, where instruments are ina ascending order.

Sticks

The following sticks and beaters are required:
1. Wood sticks
2. Yarn covered beaters (hard)
3. Rubber beaters
4. Metal stick



Information for all instruments

1. Accel-decel markings: short units of acceleration and deceleration are specified. Freedom can be exercised within these groups, but the overall tempo and timing must remain strict.

2. Accidentals: accidentals are always cancelled by the bar line unless a note is tied over into the next bar. In some instances cautionary accidentals and naturals have been indicated.

3. In many places the performers are required to improvise a texture based on a central pitch and a text description. These textures should be continuous and dense. They should be mastered so that the performer can change effortlessly from a texture to a normal note.

4. The computer part consists of layers of sound that are conducted and triggered during the performance. This method allows easier synchronisation than a continuous tape part. Nevertheless, it is important that the tempo markings are strictly adhered to. A number of copies of a CD version of the computer part, as it will sound in the performance, is available from the conductor. All performers should hear this CD and understand how their part fits into the computer part.

5. Parts which have meandering glissandi can be played with extra rubato in the rhythm, but the overall tempo and timing must remain strict.

6. Notes tied over rests should be allowed to resonate through the rest.

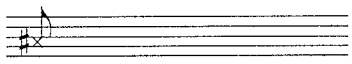
Notation - wind

Air sound with slight pitch content of specified note.

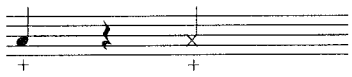
1. Move continuously from air sound to normal note,
2. move continuously from normal note to air sound.

Flutter tongue.

Textural improvisation, centre on given pitch
and add microtones and changes of fingering.



Vocal 't' or 'k' attack to note. Clarinet can
articulate with tongue slap.



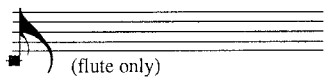
1. Loud key click,
2. vocal attack or tongue slap with key click.

Move from air sound to vocal articulation and
decelerate on normal notes, all in one phrase.

Double tonguing, accelerate and decelerate
within given tempo.

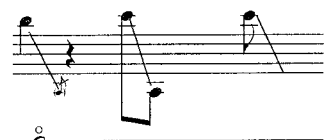
Tremolo key clicks and fast vocal articulations.

Trill using given pitches.

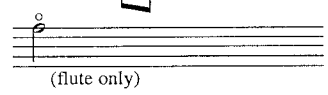


Jet whistle.

Wide slow vibrato.



1. Gliss downwards to specified pitch,
2. gliss downwards to specified pitch and then play that note,
3. gliss downwards to lowest practical pitch.
NOTE: on all glissandi, stop if the sound continuity begins to break.



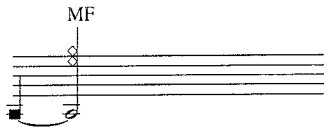
Harmonic (thin overblown sound).

Quarter tone sharp, quarter tone flat, quarter tone flatter
than Ab, quarter tone sharper than Ab.

Improvise rapid texture using specified pitches.

1. Heavily textured rolling on air noise, then on normal note.
2. Either blow directly into flute, or roll at back of throat.

Wandering glissandi (or bent notes)

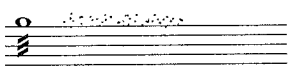


Multiphonic based on the normal note (A), with overtones
added on the diamond pitches. NOTE: no fingerings have been
provided, and if the multiphonic is problematic, find one that
is similar but reliable on your instrument. If the multiphonic
needs changing, *always* keep the normal note, in this instance the 'A'.

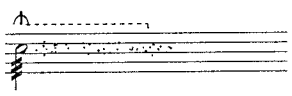
Meandering-pitch upward glissandi.

Notation - strings

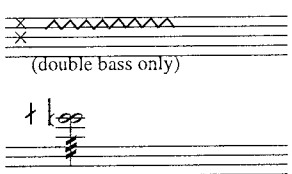
1. Bow behind the bridge, on single strings,
2. across two strings, 3. across three strings.



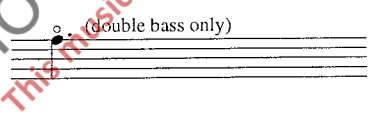
Rapid texture made from microtones around specified pitch.
If the dotted graphic slopes downwards, gliss the texture downwards.
NOTE: in general, with a two-dashed tremolo mark relax the speed of the texture.



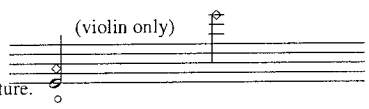
Rapid texture behind the bridge varying bow pressure
and distance from tail/bridge.



Use the nut of the bow to rapidly vibrate between strings
on the specified pitches.

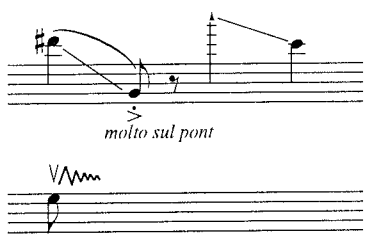


Natural harmonic.

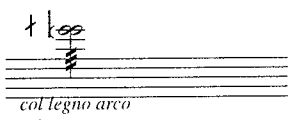


Artificial harmonic, natural harmonic.

Gliss downwards to the note in parenthesis, but do not
replay the note moved to.



1. Gliss downwards to the lower note and play that note.
2. Gliss downwards from the highest note possible without crossing strings.



Arco tremolo with the wood of the bow.

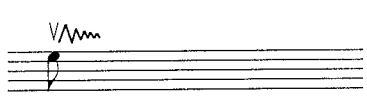
1. Arco tremolo and trill with the wood of the bow,
2. quarter tone sharp and flat with normal bow.

1. Single col legno attack.
2. Texture made from col legno attacks and pizz. (Two-dashed tremolo mark is
more relaxed in speed than the three-dashed mark).

Natural harmonic, then gliss downwards with finger touching the string
(not pressing the string down fully).

Crushed notes (high pressure on a slower moving bow to produce a
grating sound).

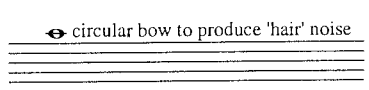
Move continuously from sul pont to sul tasto.



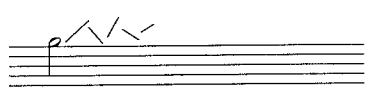
Let the bow bounce across the string.

Rapid, repetitive gliss.

1. Tremolo on both notes,
2. tremolo on first note but not on second note in one bow.
NOTE: observe all articulations where only one note out of a pair is specified
with that articulation.



Instead of bowing across the string, move the bow in a circular motion.
The sound should contain noise from the hair of the bow as well as the fingered pitch.



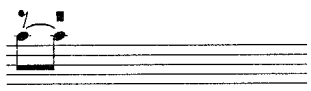
Rapid small gliss up and down around specified pitch. The effect is a 'squiggly' sound.

Rapid small gliss up and down around main upwards gliss.

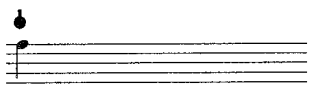
'nat.' is used to cancel *sul pont* and *sul tasto* indications.

Notation - Piano

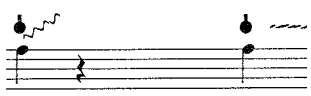
Dampen piano string by pressing heavily with a wide, solid piece of rubber. The rubber needs to span approximately four notes. Suggested rubber items are a piece of wood with a layer of rubber stuck to one side, or a solid rubber strip. Once string is dampened, play note via the keyboard.



Play a normal note and then dampen part of the resonance with the rubber (keep note depressed on the keyboard to stop piano dampers).

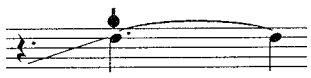


Touch a plastic ball or curved piece of wood on the string. When the note is played on the keyboard, a bright buzzing resonance should be heard. Suggested item is a hollow plastic child's ball, about 7 cm in diameter with holes to provide a means to hold it. Alternatively, any rounded hard surface that can be easily gripped.



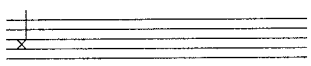
1. Play note on keyboard and then wobble the ball along the string.
2. Play note on keyboard and then wobble the ball in one position.

1. Play note on keyboard and then scrape the ball along the string,
2. run the rubber along the string in two different directions while playing.

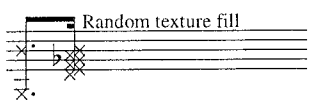


Scrape along the string with the ball, and then play the note via the keyboard.

Gently depressed note on keyboard to raise the piano dampers, then drop ball onto the string and allow it to bounce.

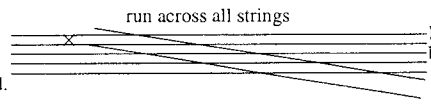


Raise piano dampers and then hit the note inside the piano with a stick. The sound should be clear and bright.

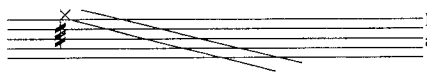


Raise piano dampers and play a rapid texture on specified notes with sticks inside piano.

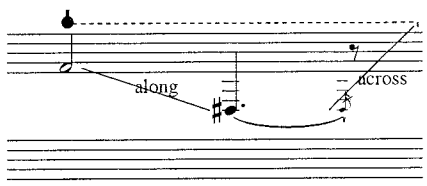
Raise piano dampers and tremolo along the string.



Raise piano dampers and run sticks across all piano strings (a loud, bright and resonant sound).



Raise piano dampers and run sticks across all strings with tremolo articulation.



Touch string with ball, play note on keyboard and run ball along the string. Play the second note, raise the dampers, and then run the ball across all strings.

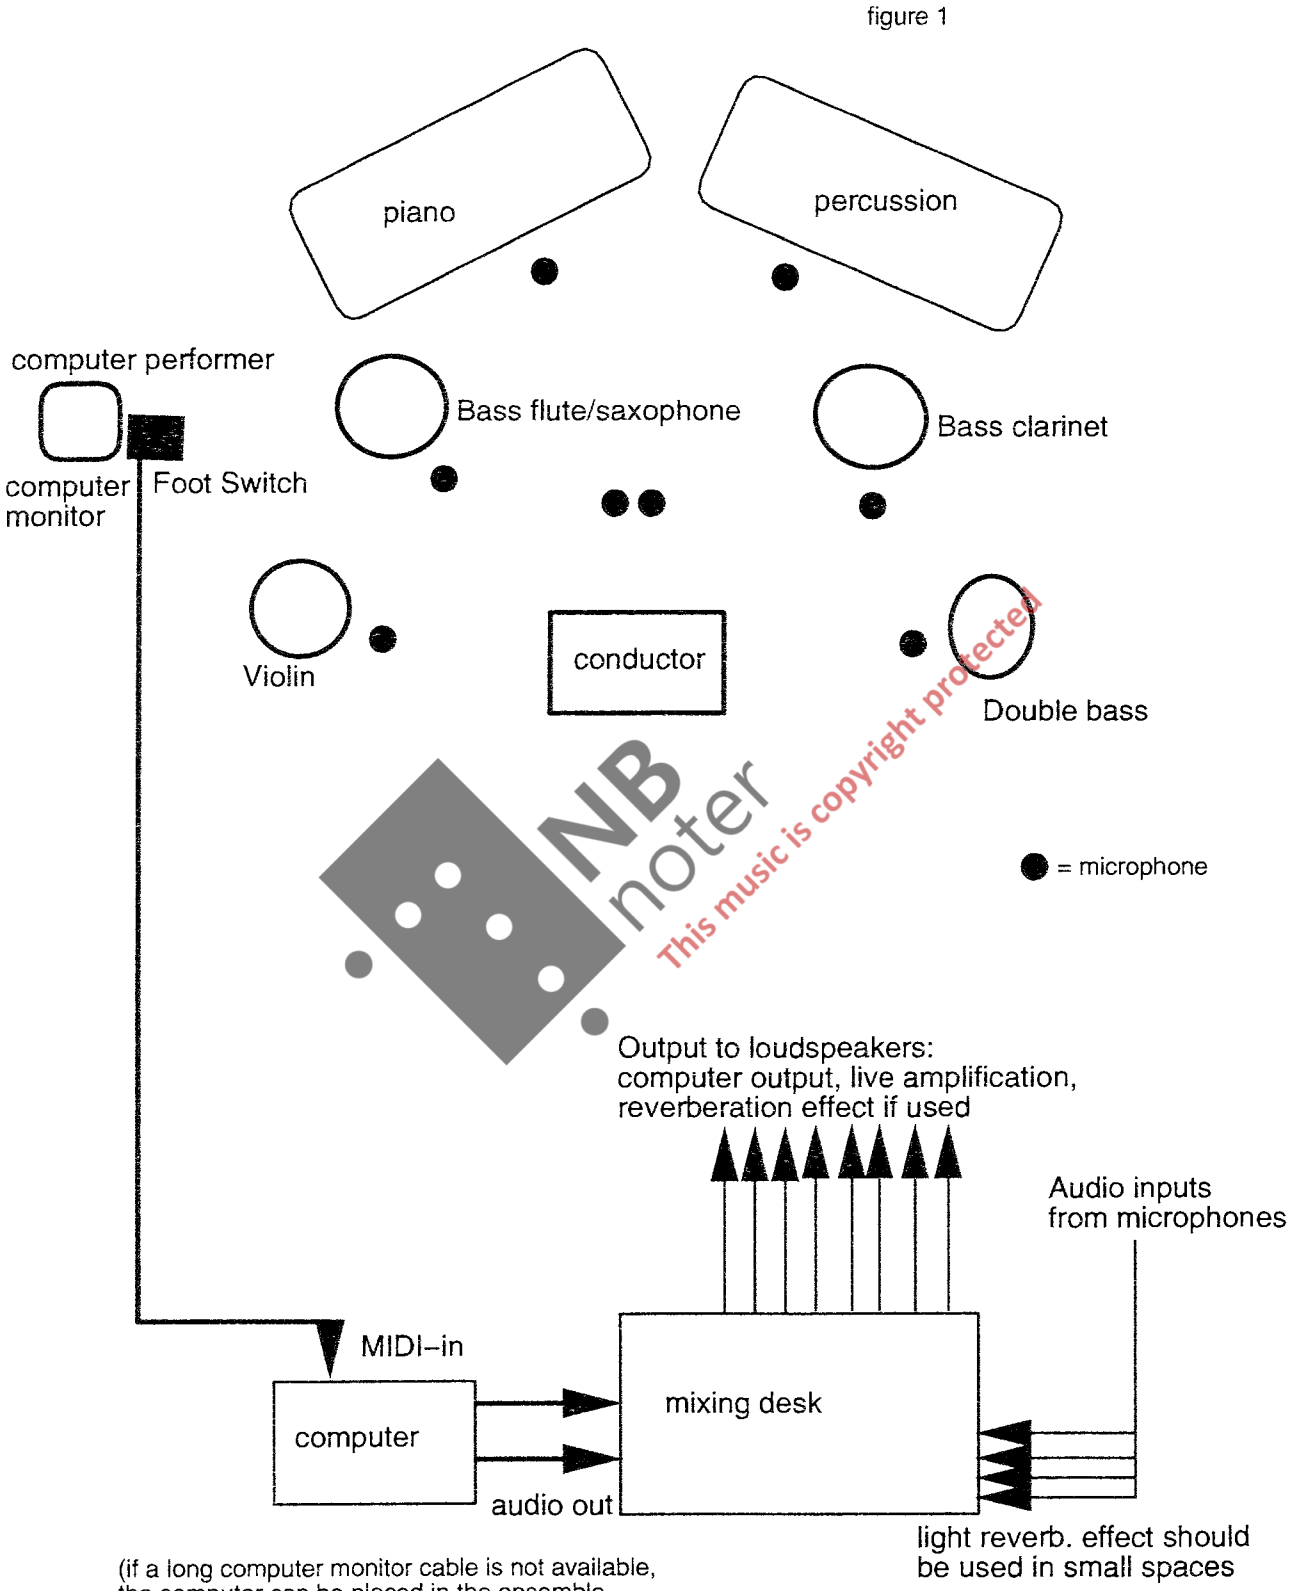
Information specific to the piano.

1. Sounds produced by playing inside the piano are spread over the range of the instrument. It is therefore recommended that the pianist 'prepare' the inside of the piano with reminders. For example, small pieces of paper with note letters can be laid under the strings inside the piano'.

2. Most sounds using the sticks, the ball, and the rubber, should be clear and resonant. Observe the dynamics carefully in these passages.

Buoyant Charm – performance set–up

figure 1



(if a long computer monitor cable is not available,
the computer can be placed in the ensemble.
If the computer makes any significant noise it should
be placed in a sound–proof box. (e.g. the new G4 and
B&WG3 macs are quiet, while the older beige G3 macs are noisey.)

NOTE: full score in concert pitch.
